OUTDOOR LIVING / SELECTION NOTES

All-in-One Outdoor Kitchens

An enclosed kitchen format for a compact, organised outdoor cooking area.

Understand the format

An enclosure brings the cabinet run, worktop and protective closing system into one coordinated unit. Catalogue references show flip-up panel and roller-shutter arrangements. Closing the unit is not a guarantee of performance in every weather condition.

Choose an opening system

Allow space for the full movement of the selected opening panel or shutter and for maintenance access. Check the finished site, overhead obstructions and working area against the final installation drawing.

Match the enclosure and cabinet specification

Selected catalogue constructions describe aluminum exterior panels with honeycomb inner panels, and stainless-steel or stone countertop choices. Other enclosed series use different structures. Confirm the chosen frame, panels, countertop and hardware as one specification.

Confirm equipment and utilities

Cooking appliances, refrigeration, sinks, taps, lighting and electrical fittings may be optional. Establish the exact equipment list, electrical requirements and water or drain locations before the order is approved. Installation must follow the appliance instructions and applicable local requirements.

Use an approved drawing for dimensions

Catalogue editions contain inconsistent size labels. This guide therefore avoids a fixed size chart. Request the drawing for the selected configuration, including overall envelope, opening clearance, access route and connection positions.

Reference and scope

Source basis: Outdoor kitchen catalog English, updated October source pack, PDF pages 5-9, 12-16. Dimensions and lighting values are intentionally omitted because the supplied editions disagree. This guide is not an installation manual.

Images show configuration ideas. Appliances, accessories, materials and site work are included only when listed in the agreed quotation. Confirm the final drawing and specification before ordering.
